

Candidate contribution

1

Issue review

run by · LLM agent

rejects: vague specs, unsupported claims

e.g., issue uses parameter k but never defines it

2

Compile-time type checks

run by · Rust compiler

rejects: API misuse, type errors

e.g., trait Problem not satisfied for Foo

3

Unit tests

run by · CI

rejects: evaluation and serialization bugs

e.g., `assert eval(0,1) == 2` - failed

4

Round-trip tests

★ this work

run by · CI

rejects: drift between contributor's example and the artifact

e.g., JSON fixture's target $\neq$ PDF manual's diagram

5

Agentic feature tests

★ this work

run by · LLM agent (fresh context)

rejects: usability and semantic errors at the CLI surface

e.g., persona expected `pred solve` to print the cut; CLI prints nothing

6

Manual verification

run by · Contributor

rejects: subtle misinterpretations of the original math

e.g., reduction direction reversed: $A \rightarrow B$ implemented as $B \rightarrow A$

Verified library entry
